# ANNALI IDROLOGICI

## 1977

## PARTE SECONDA

ROMA
Istituto Poligrafico dello Stato
Libreria
1990

Nota: I dati di precipitazione necessari per il calcolo degli afflussi e dei bilanci dei bacini idrografici dell'Adige e del Brenta sono stati forniti, per le parti di rispettiva competenza, dagli Uffici Idrografici delle Province Autonome di Trento e Bolzano.

# INDICE

# Sezione A - AFFLUSSI METEORICI

## TERMINOLOGIA

1. - Afflusso meteorico ($m^3$) ad un bacino idrografico in un dato intervallo di tempo: volume totale della precipitazione sul bacino in quell'intervallo.

2. - Altezza di afflusso meteorico (*mm*) ad un bacino idrografico per un determinato intervallo di tempo: spessore dello strato d'acqua di volume pari all'afflusso meteorico in quell'intervallo ed uniformemente distribuito sulla superficie del bacino.

3. - Contributo medio di afflusso meteorico ($l/s\ km^2$) ad un bacino idrografico in un dato intervallo di tempo: quoziente fra afflusso meteorico al bacino nell'intervallo ed il prodotto della durata di questo per l'area del bacino.

## CONTENUTO DELLA TABELLA

Riporta, per gli interi bacini imbriferi e per le loro parti più importanti, le altezze di afflusso meteorico mensili ed annue, espresse in *mm*, ed i corrispondenti contributi medi espressi in $l/s\ km^2$. Per ogni stazione il contributo mensile più elevato è stampato in **grassetto** e quello più basso in *corsivo*.

| Quota approssimata della località ov'è situato l'idrometro dedotta dalle tavolette dell'I.G.M. ................................... | * |

Sono stampati in **grassetto** ed in *corsivo* rispettivamente i valori massimi ed i valori minimi

## TERMINOLOGIA

1. - Altezza idrometrica (cm): altezza del livello liquido sopra o sotto lo zero dell'idrometro.
2. - Altezza di massima piena (o magra) in una sezione fornita di idrometro e per un lungo periodo di osservazione: massima o minima altezza idrometrica (m) raggiunta in tutto il periodo di tempo in cui sono state eseguite le osservazioni.

## CONTENUTO DELLA TABELLA

La tabella è preceduta dall'elenco e caratteristiche delle stazioni idrometriche che hanno funzionato nell'anno.

TABELLA 1 - Riporta, per alcune stazioni, le altezze idrometriche meridiane rilevate direttamente all'idrometro da parte dell'osservatore oppure dedotte in corrispondenza del mezzogiorno dallo spoglio dei diagrammi per le stazioni fornite di apparecchio registratore.

CONSISTENZA DELLA RETE IDROMETRICA AL 31 DICEMBRE 1977

(a) Il 1° gennaio 1932 lo zero dell'idrometro venne abbassato di m 3.76. Dal 1° agosto 1933 lo zero dell'idrometro venne alzato di m 3.88.

(b) Nel 1946 lo zero dell'idrometro venne abbassato di m 0.18.

(c) Funzionò anche dall'anno 1915 al 1917.

(1) L'altezza di massima piena è stata superata nel novembre del 1966, ma causa l'asportazione dello strumento non è stato possibile ricavarne il dato. (2) Al reale bacino di dominio sono stati tolti Km 136.40 che competono rispettivamente al bacino imbrifero del Tesa (Km 117.22) e del Lago di S. Croce (Km 19.18) le cui acque, in seguito alla costruzione degli impianti idroelettrici del gruppo di Santa Croce, scaricarono nel bacino del Meschio (Livenza). (3) Non si tiene conto dei livelli raggiunti nell'ondata di piena causata dalla frana caduta sul Vajont.

# Sezione C - PORTATE E BILANCI IDROLOGICI

**Abbreviazioni e segni convenzionali**

| | |
|---|---|
| Stazione per misura di portata con idrometro a lettura diretta ..... | M |
| Stazione per misura di portata con idrometrografo .............. | Mr |
| Dato mancante .......................................... | » |
| Dato incerto .......................................... | ? |
| Dato interpolato .......................................... | [ ] |
| Sponda sinistra .......................................... | sp. s. |
| Sponda destra .......................................... | sp. d. |
| Metri sul mare .......................................... | *m* s.m. |

Sono stampati in **grassetto** ed in *corsivo* rispettivamente i valori massimi ed i valori minimi

## TERMINOLOGIA

1. - Portata in una sezione e in un dato istante ($m^3/s$): volume di acqua che attraversa la sezione durante l'unità di tempo (minuto secondo) che comprende quell'istante.

2. - Portata unitaria (o contributo) relativa ad una determinata sezione ($l/s\ km^2$): rapporto tra la portata nell'unità di tempo (l/s) e l'area del bacino imbrifero sotteso dalla sezione.

3. - Portata media di una sezione e per un dato intervallo di tempo: rapporto tra il deflusso relativo all'intervallo e la durata di questo.

4. - Modulo di una sezione: portata media di un gran numero di anni.

5. - Portata giornaliera in una sezione e per un determinato giorno: portata media nella sezione in quel giorno.

6. - Durata di una determinata portata Q in una sezione e relativamente ad un certo intervallo di tempo: numero di giorni di quell'intervallo, nei quali si è verificata una portata non inferiore a Q.

7. - Portata semipermanente in una sezione e in un dato intervallo di tempo: portata che non è stata superata per metà dei giorni dell'intervallo (ossia di durata uguale a metà dell'intervallo).

8. - Portata semiannuale di un anno determinato: la portata semipermanente di quell'anno.

9. - Deflusso in una determinata sezione e per un determinato intervallo di tempo ($m^3$): volume liquido che ha attraversato la sezione nell'intervallo.

10. - Altezza di deflusso di un bacino idrografico per un determinato intervallo di tempo (mm): spessore dello strato d'acqua di volume pari al deflusso superficiale del bacino in quell'intervallo e uniformemente distribuito sulla superficie del bacino.

11. - Deflusso giornaliero di una determinata sezione e per un dato giorno ($m^3$): volume liquido che ha attaversato la sezione in quel giorno.

12. - Deflusso unitario relativo ad una determinata sezione ed in un dato intervallo di tempo ($m^3/km^2$): rapporto tra il deflusso dell'intervallo e l'area del bacino imbrifero sotteso dalla sezione.

13. - Perdita apparente di un bacino idrografico in un determinato intervallo di tempo: differenza tra l'altezza di afflusso meteorico e l'altezza di deflusso relative all'intervallo.

14. - Coefficiente di deflusso di un bacino idrografico in un determinato intervallo di tempo: rapporto fra l'altezza di deflusso e l'altezza di afflusso meteorico relative all'intervallo.

# CONTENUTO DELLE TABELLE

Le tabelle sono precedute da una cartina del Compartimento, corredata di un elenco, ove sono ubicate le stazioni di misura che hanno regolarmente funzionato nell'anno.

Nelle tabelle, per ogni stazione, sono riportati:

a) le caratteristiche della stazione e del bacino che alimenta il corso d'acqua relativo, con l'indicazione delle altezze idrometriche e delle portate massime e minime rilevate nel periodo di osservazione;

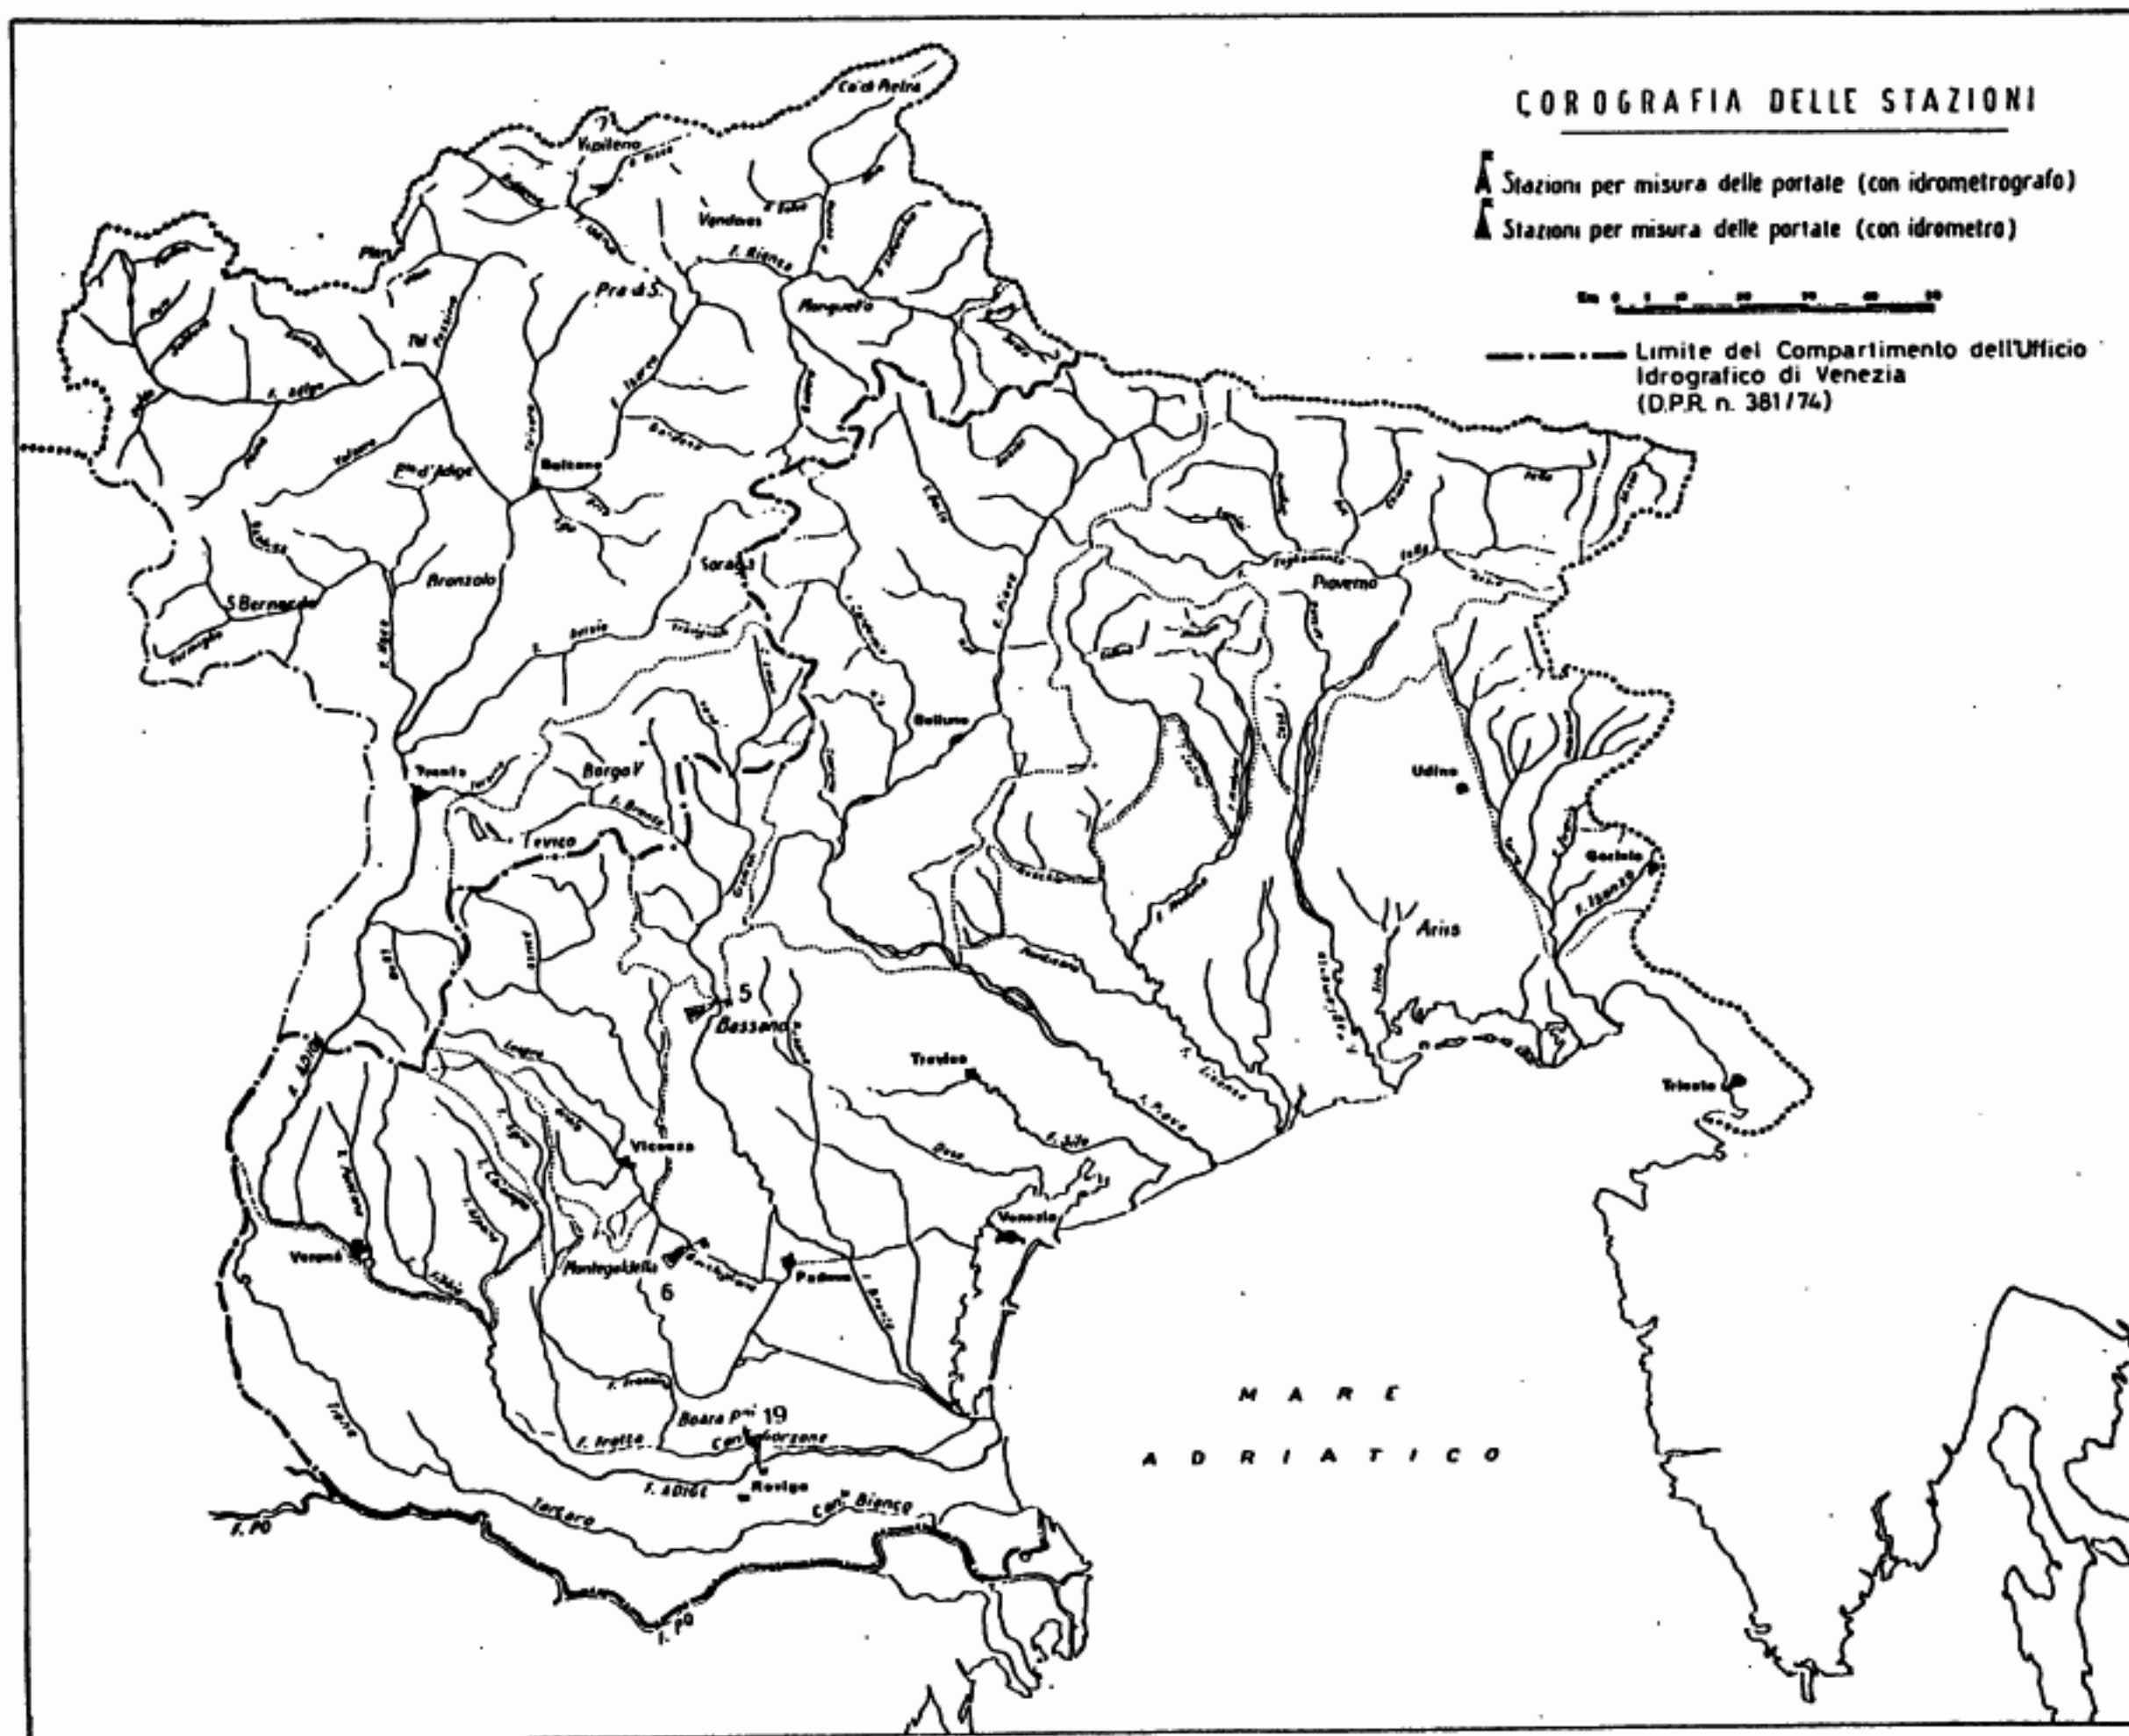
b) le portate medie giornaliere espresse in $m^3/s$;

c) gli elementi caratteristici, mensili ed annui, dell'anno e del precedente periodo di osservazione: le portate, in $m^3/s$, massime, minime e medie giornaliere, i deflussi e gli afflussi in mm; i coefficienti di deflusso (rapporto tra i deflussi e i corrispondenti afflussi). I valori calcolati dei coefficienti di deflusso dei mesi primaverili-estivi sono inferiori a quelli reali perché i deflussi, misurati nei vari corsi d'acqua, in corrispondenza delle stazioni di misura, sono influenzati dalle derivazioni ad uso irriguo esistenti a monte delle stazioni stesse;

d) le portate medie giornaliere corrispondenti a valori caratteristici delle durate espresse in giorni;

e) la scala numerica delle portate, cioè la traduzione analitica della relazione intercorrente tra le portate e le altezze idrometriche rilevate nella sezione di misura, valide per l'anno cui si riferiscono gli Annali, o per i periodi dello stesso anno, ove specificato.

# ELENCO DELLE STAZIONI

1. - BRENTA a BARZIZA (Bassano)
2. - BACCHIGLIONE a MONTEGALDELLA
3. - ADIGE a BOARA PISANI


## 1 - BRENTA a BARZIZA (Bassano) (Mr) *Anno 1977*

CARATTERISTICHE DELLA STAZIONE: Bacino di dominio: 1567 km$^2$ (parte permeabile 66%); aree glaciali 0.03 km$^2$; altitudine max 3185 m s.m.; media 1256 m s.m.; zero idrometrico 105.83 m s.m.; distanza dalla foce km 105 circa; inizio osservazioni marzo 1950; inizio misure agosto 1946. Altezza idrometrica max m 6.80 (4 novembre 1966); minima m 0.39 (23 gennaio 1955). Portata max m$^3$/s 2800 (4 novembre 1966). Minima m$^3$/s 14.0 (vari gennaio - febbraio 1922).

## 3 - ADIGE a BOARA PISANI (Mr)

*Anno 1977*

CARATTERISTICHE DELLA STAZIONE: Bacino di dominio: 11954 km² (parte permeabile 43.9%); aree glaciali 154 km²; altitudine max 3899 m s.m.; media 1535 m s.m.; zero idrometrico 81.61 m s.m.; distanza dalla foce km 51 circa; inizio osservazioni anno 1853; inizio misure ottobre 1917. Altezza idrometrica max m 3.99 (2 novembre 1928); minima m -3.32 (11 novembre 1969). Portata max m³/s 1700 (2 novembre 1966). Minima m³/s 56.6 (8 settembre 1962).

## TERMINOLOGIA

Altezza freatimetrica (*m*): altezza del livello liquido nel pozzo sul livello del mare.

## CONTENUTO DELLE TABELLE

Le tabelle sono precedute dall'elenco e caratteristiche delle stazioni freatimetriche che hanno funzionato nell'anno.

TABELLA I - Riporta i valori dei livelli freatrici, riferiti al medio mare, rilevati nei giorni 2, 5, 8, 11, 14, 17, 20, 23, 26 e 29 di ogni mese (eccetto per il mese di febbraio in cui l'ultimo valore si riferisce al giorno 28), ed il valore medio corrispondente.

TABELLA II - Per ognuna delle stazioni considerate nella Tabella I, riporta la quota del piano di campagna ove la stazione è situata ed i valori medi mensili ed annui dei livelli freatici.

# MAREOGRAFIA

Nel presente capitolo sono riportati i valori dell'alta e bassa marea osservati durante l'anno nella Stazione Mareografica di PUNTA della SALUTE.

## CONTENUTO DELLE TABELLE

Le tabelle riportano i valori di alta e bassa marea registrati nella Stazione e l'orario in cui si sono verificati.

Nelle tabelle, per ciascun mese dell'anno, sono riportati:

a) per ogni giorno del mese gli orari in cui si sono verificati gli estremi;
b) i valori degli estremi (alta e bassa marea) espressi in cm;
c) le medie delle altezze di alta e bassa marea per ciascuna decade;
d) la media mensile delle altezze di alta e bassa marea.

Le altezze di marea riportate nelle tabelle sono riferite allo zero mareografico di PUNTA della SALUTE (corrispondente, nel 1897, al piano fondamentale della rete altimetrica dello Stato).

Tale livello di riferimento si trova attualmente ad una quota inferiore di circa 23 cm al livello medio marino attuale.

Sono stampati in **grassetto** ed in *corsivo* rispettivamente i valori massimi ed i valori minimi.

# CARATTERI IDROLOGICI DELL'ANNO 1977

Lo scopo del presente capitolo è quello di mettere in evidenza le caratteristiche idrologiche e climatiche dell'anno 1977 confrontando i valori rilevati negli Osservatori meteorologici di Trieste, Venezia - Lido, Padova e Sadocca, ed in alcune Stazioni termopluviometriche, idrometriche e di misura delle portate, opportunamente scelte nel Compartimento, con i rispettivi valori medi di un lungo periodo di osservazioni (*"valori normali"*).

## I. - TEMPERATURA

Una prima lettura della Tab. I indica che l'anno 1977, per quanto riguarda le temperature medie mensili, non si è scostato sensibilmente dalle medie del periodo.

Sadocca evidenzia una media annua uguale a quella annua del periodo.

L'analisi delle medie mensili conferma l'andamento regolare delle temperature nell'anno 1977.

Il mese più caldo è stato luglio, confermando i dati del periodo, quello più freddo è stato dicembre, mentre il più freddo del periodo risulta gennaio.

Rispetto alle medie mensili del periodo, quelle mensili del 1977 presentano le seguenti variazioni:

- gennaio, febbraio e marzo sono stati più caldi in tutte le stazioni;
- aprile, agosto e settembre sono stati più freddi in tutte le stazioni;
- maggio ha mantenuto la stessa temperatura del periodo nelle stazioni di Trieste e di Udine, mentre nelle altre stazioni ha oscillato intorno alla media normale;
- gli altri mesi hanno oscillato intorno alla media normale.

Comunque le variazioni della media si sono sempre mantenute entro piccoli ordini di grandezza.

## II. - PRESSIONE ATMOSFERICA

L'esame della Tabella III, che riporta i valori mensili medi ed assoluti della pressione nell'anno 1977 e nel periodo 1914-1972 registrati nell'osservatorio di Venezia-Lido, pone in evidenza che la pressione media annua è stata maggiore della pressione media del periodo, mentre quella mensile è stata maggiore nei mesi di marzo, aprile, maggio, settembre, ottobre e dicembre e minore negli altri mesi; che lo scostamento positivo massimo è stato in dicembre e quello negativo in febbraio; che l'escursione massima si è avuta in gennaio e infine che l'escursione nei singoli mesi è stata inferiore alla media, salvo nei mesi di gennaio e aprile.

## III. - VENTO

Come viene indicato dalla Tab. IV, l'anno 1977 è stato meno ventoso nell'osservatorio di Trieste, mentre a Padova si è mantenuto intorno alla media del periodo.

Il mese meno ventoso è stato gennaio a Trieste e a Padova; quelli più ventosi settembre e dicembre a Trieste e luglio a Padova.

L'osservatorio di Venezia-Lido non ha funzionato nel 1977, mentre in quello di Sadocca sono mancanti i dati dei primi 6 mesi.

## IV. - NEBULOSITÀ

La Tab. VII indica che l'anno 1977 è stato più sereno rispetto alla media del periodo in tutte le stazioni di osservazione.

Come è naturale, i mesi estivi sono stati più sereni, mentre quelli invernali sono stati più coperti con un massimo di 8,5/10 di cielo coperto in gennaio a Venezia.

## V. - UMIDITÀ RELATIVA

La Tab. VIII indica che l'umidità relativa è stata mediamente superiore al normale, ma la media annua del 1977 non si scosta molto dalla media normale.

Ovviamente i mesi più umidi sono stati quelli invernali e quelli meno umidi quelli estivi. Il mese più umido in tutte le stazioni è stato gennaio.

A questo punto si può dire che tutte le tabelle analizzate finora confermano che l'anno 1977 si è adeguato alla normalità del periodo.

Basta osservare la Tab. I e la Tab. VIII per rendersi conto che gli eventi atmosferici e le temperature dell'aria non hanno avuto alcun carattere originale rispetto alla normalità.

## VI. - PRECIPITAZIONI

La Tab. IX fornisce la distribuzione degli afflussi meteorici durante l'anno in determinate stazioni del Compartimento.

Molte delle stazioni prese in esame in detta Tabella evidenziano un rapporto superiore alla media del periodo (massimo a Verona 1,50 e minimo a Udine 1,06), mentre nelle altre il rapporto è inferiore alla media del periodo con un minimo a Cison di Valmarino e a Forni Avoltri (0,91) rispettivamente di 161,4 e 127,9 mm di precipitazione in meno in un anno.

Il mese più piovoso è stato gennaio, salvo a Trieste, Verona ed Este in cui è stato agosto.

I mesi di gennaio e febbraio sono stati invece i meno piovosi in tutte le stazioni.

La Tab. IX non riporta risultanze conclusive; ogni stazione ha un proprio andamento particolare, ma in generale si può affermare che la distribuzione delle precipitazioni dell'anno 1977 sia stata regolare.

Le Tabb. X e XI rappresentano le quantità massime di precipitazione in periodi di più ore e più giorni consecutivi.

## VII. - IDROMETRIA

Come risulta dalla Tab. XII, il 1977 è stato un anno relativamente tranquillo durante il quale non si sono verificati eventi da considerarsi eccezionali.

Si può rilevare infatti che le altezze idrometriche (vedi sezione "Idrometria" Tab. I) registrate nelle stazioni del Compartimento risultano comprese tra le massime e le minime del periodo.

Le uniche eccezioni sono rappresentate dall'Adige a Boara Pisani e dal Brenta a Barziza che nel 1977 hanno presentato minime altezze idrometriche inferiori alle minime del periodo precedente.

## VIII. - PORTATE E BILANCI IDROLOGICI

Pur considerando che i valori delle portate, soprattutto di quelle minime, sono state alterate da operazioni di invaso e svaso di serbatoi a monte per usi idroelettrici e, per i corsi d'acqua principali, anche da derivazioni per usi diversi e promiscui spesso senza restituzione, si può affermare che la scarsità del regime idrico nei corsi d'acqua compresi nel Compartimento per il 1977, come risulta anche dalla Tab. XIII, conferma i dati precedentemente presentati.

In definitiva, entro i limiti della presente trattazione e a conclusione di questa breve analisi, si può asserire che l'andamento stagionale dell'anno 1977 rientra nella normalità pur con le alternanze climatologiche che fanno contraddistinguere i vari periodi che si susseguono, caratterizzandone, in maniera più o meno significativa, le risultanze dei fenomeni metereologici.
